

# Simplifying method

February 1, 2014

A Simplifying method is a type of method in an expression class used by the SimplifyAll function (in Data/EntityClass.py). It will try to return a simplified version of the class instance, but if it cannot/shouldn't simplify, a simplifying method must return False.

For a simplifying method to be used in the SimplifyAll function, simply add the name of the method to the [NAME OF CLASS].simplifymethods file in Data/simplify methods.
